Non-Vegans are the Future.

Estimates have the number of individuals that practice a vegan diet to be lower than ten percent of Earth's human population.

Estimates also expect that eighty percent of humans rely on fossil fuels. Fossil fuels release methane and carbon dioxide into the earth's atmosphere creating an imbalance for the amount of oxygen in the air that's available to humans.

The Vegan Digest believes that if planet Earth is 1) to observe a reduction in the billions of commercial farm animals that are needlessly inseminated, herded, or overfished where it concerns sea-dwelling creatures and 2) eliminate the over-pollution of Earth's atmosphere by the direct carbon emission from man-made tools as well as carbon emission from man's farmed animals with farm animal populations that have reached highly unnatural quantities and 3) reduce the heavy levels of deforestation on Earth created from these animal cruelty practices as well as from carbon emitting practices; non-vegans have to speak up and act with their consumer practices.

TVD Map will take you there.
